

ABSTRACT

AUDIO APPARATUS, AUDIO VOLUME CONTROL METHOD IN AUDIO APPARATUS, AND COMPUTER APPARATUS

An audio apparatus that enables audio output and volume to be controlled according to the usage situation is provided for. In an audio apparatus of the present invention, certain hypothetical connection situations are compared with actual connection situations, and when the actual connection situation matches a described hypothetical connection situation, the audio volume corresponding to that hypothetical connection situation is extracted from storage, and is used as the audio volume to be output from the audio apparatus.
